I.; Nolan, P.; Olver, C.; Rinta-Hiiro, V.; Roebeling, P.; Sánchez, I.; Sanesi, G.; Sanz, J. M.; Spano, G.; Tomé-Lourido, D.; Villazán, A.; Young, C.; zu-Castell Rüdenhausen, M.

## **21 RECOMMENDED INDICATORS OF HEALTH AND WELLBEING**

## 21.1 Level of outdoor physical activity

Project Name: CONNECTING Nature (Grant Agreement no. 730222)

Author/s and affiliations: Adina Dumitru<sup>1</sup>, Catalina Young<sup>2</sup>, Irina Macsinga<sup>2</sup>

<sup>2</sup> West University of Timisoara, Romania

Level of outdoor p	hysical activity	Health and Wellbeing
Description and	The outdoor environment may i	nfluence how physically
justification	active an individual is by offerin	g suitable spaces for certain
	types of activities. It may also a	ittract people outdoors
	because of the experiences it of	fers. Such outings ordinarily
	entail some form of physical act	ivity, usually walking
	(Hartig, Mitchell, de Vries, & Fru	<u>umkin, 2014</u> ). Numerous
	studies in various countries hav	e shown that access to, and
	use of, urban green space contr	ibutes to increased physical
	activity, higher rates of recreati	onal walking and reduced
	sedentary time (Almanza, Jerre	<u>tt, Dunton, Seto, Pentz,</u>
	2012; Schipperijn, Bentsen, Tro	elsen, Toftager, <u>&amp;</u>
	Stigsdotter, 2013; Lachowycz a	nd Jones, 2014; Sugiyama
	et al., 2014; Braubach et al., 20	) <u>17;</u> <u>Sallis et al., 2016</u> ).
	This has been proven valid for a	II age categories, including
	children, working age adults and	d senior citizens. For
	example, a comprehensive stud	y conducted by <u>Schipperijn</u>

	et al. (2013) has demonstrated positive associations between urban green space and both physical activity and positive affect. Greater surrounding greenness has been linked to improved physical and mental health in all socioeconomic strata and in both sexes in Spain (Triguero-Mas et al., 2015). As documented under indicator HW 10 (Prevalence, incidence, morbidity of chronic stress), two complementary theoretical perspectives explain the psychological pathways of beneficial effects of nature on health, wellbeing, and mental states, namely Attention Restoration Theory (ART - Kaplan, 1995) and Stress Recovery Theory (SRT - Ulrich et al., 1991). Mental restoration and relaxation from leisure activities (e.g., walks in parks vs. walks in urban settings, gardening) pursued in the nature and green space have been studied as strong evidence of mental health benefits consequent to nature experience (Aspinall, Mavros, Coyne, & Roe, 2013; Bratman et al., 2015; Braubach et al., 2017; Hartig et al., 2014; van den Berg & Custers, 2011).
Definition	Schipperijn et al. (2013) defined: *Outdoor Physical activity as self-reported participation in organized or unorganized sport or exercise, outdoors, at least once a week. *Physical activity in urban green space (UGS) as the self- reported participation in sport or exercise taking place in the nearest UGS at least once a week. ***UGS can be replaced by NBS, as defined by current project, to apply the same definition to further measurements
Strengths and weaknesses	<ul> <li>+ reliable indicator of physical and mental health, well- being, and life expectancy (Braubach et al., 2017; Frumkin et al., 2017; Klein et al, 2016)</li> <li>+ solid empirical evidence as to relationship between physical and mental health, and wellbeing, and physical activity in nature and urban green space (parks, playgrounds, and residential greenery)</li> <li>+ robust empirical evidence for the role of physical activity in cardiovascular disease and obesity</li> </ul>
Measurement procedure and tool	<ul> <li>Quantitative P: Scale/Scale inventory/Questionnaire (survey procedure, paper-and-pencil administration, computer-based administration)</li> <li>T: International Physical Activity Questionnaire (IPAQ) (International Physical Activity Questionnaires, n.d.). IPAQ (both long - 27 items, and short form - 7 items) assesses physical activity undertaken across a comprehensive set of domains including:</li> <li>leisure time physical activity</li> </ul>

	<ul> <li>domestic and gardening (yard) activities</li> <li>work-related physical activity</li> <li>transport-related physical activity</li> </ul>
Scale of measurement	<ul> <li>International Physical Activity Questionnaire (IPAQ – short/7 items) (<u>International Physical Activity</u> <u>Questionnaires, n.d.</u>)</li> </ul>
	See website for the International Physical Activity Questionnaire (IPAQ) for information about the use of the questionnaire and links to the questionnaire itself, in multiple languages: <u>https://sites.google.com/site/theipaq/questionnaire_links</u>
	We are interested in finding out about the kinds of physical activities that people do as part of their everyday lives. The questions will ask you about the time you spent being physically active in the last 7 days. Please answer each question even if you do not consider yourself to be an active person. Please think about the activities you do at work, as part of your house and yard work, to get from place to place, and in your spare time for recreation, exercise or sport. Think about all the vigorous activities that you did in the last 7 days. Vigorous physical activities refer to activities that take hard physical effort and make you breathe much harder than normal. Think only about those physical activities that you did for at least 10 minutes at a time.
	<b>1.</b> During the last 7 days, on how many days did you do vigorous physical activities like heavy lifting, digging, aerobics, or fast bicycling? days per week No vigorous physical activities Skip to question 3
	2. How much time did you usually spend doing vigorous physical activities on one of those days? hours per day minutes per day Don't know/Not sure Think about all the moderate activities that you did in the last 7 days.
	Moderate activities refer to activities that take moderate physical effort and make you breathe somewhat harder than normal. Think only about those physical activities that you did for at least 10 minutes at a time.
	<b>3.</b> During the last 7 days, on how many days did you do moderate physical activities like carrying light loads, bicycling at a regular pace, or doubles tennis? Do not include walking days per week No moderate physical activities Skip to question 5

<ul> <li>4. How much time did you usually spend doing moderate physical activities on one of those days?hours per day minutes per day Don't know/Not sure Think about the time you spent walking in the last 7 days. This includes at work and at home, walking to travel from place to place, and any other walking that you have done solely for recreation, sport, exercise, or leisure.</li> <li>5. During the last 7 days, on how many days did you walk for at least 10 minutes at a time? days per week No walking Skip to question 7</li> <li>6. How much time did you usually spend walking on one of those days? hours per day minutes per day Don't know/Not sure The last question is about the time you spent sitting on weekdays during the last 7 days. Include time spent at work, at home, while doing course work and during leisure time. This may include time spent sitting at a desk, visiting friends, reading, or sitting or lying down to watch television.</li> <li>7. During the last 7 days, how much time did you spend sitting on a week day? hours per day minutes per day Don't know/Not sure</li> <li>Data source</li> <li>Required data</li> <li>✓ Essential: NBS characteristics for each city/site, more specifically nature of activities one can get involved into while engaging with nature, opportunities for physical exercise, etc.</li> <li>Data collection frequency</li> <li>EV After NBS implementation and aligned with timing relevant to HW12 and synergies with other indicators</li> <li>SC3 Geographical access to NBS</li> <li>SC3 Geographical access to NBS</li> <li>HW3 General Wellbeing and Happiness</li> <li>HW4 Life expectancy and healthy life years expectancy HW6 Prevalence, incidence, morbidity of chronic stress HW1 Motorscular diseases</li> <li>HW4 Dife velaence, incidence, morbidity of chronic stress HW1 Mental Health Wellbeing: Depression and Anxiety HW10 Prevalence, incidence, morbidity of chronic stress HW1 Mental Health Wellbe</li></ul>		
Data sourceRequired data✓ Essential: NBS characteristics for each city/site, more specifically nature of activities one can get involved into while engaging with nature, opportunities for physical exercise, etc.Data input typeQuantitativeData collection frequencyAfter NBS implementation and aligned with timing relevant to HW12 and synergies with other indicatorsLevel of expertise requiredImage: Methodology and data analysis requires high expertise in psycho-social researchSynergies with other indicatorsSC7 Geographical access to NBS SC8 Perceived access to NBS HW3 General Wellbeing and Happiness HW4 Life expectancy and healthy life years expectancy HW6 Prevalence, incidence, morbidity, and mortality of cardiovascular diseases HW8 Incidence of obesity/obesity rates (adults and children) HW10 Prevalence, incidence, morbidity of chronic stress HW11 Mental Health Wellbeing: Depression and Anxiety HW13 Improvement of behavioural development and symptoms of attention-deficit/hyperactivity disorder (ADHD) HW14 Exploratory behaviour in childrenConnection withGoal 3. Ensure healthy lives and promote well-being for all		<ul> <li>day minutes per day Don't know/Not sure Think about the time you spent walking in the last 7 days. This includes at work and at home, walking to travel from place to place, and any other walking that you have done solely for recreation, sport, exercise, or leisure.</li> <li>5.
