Projected maximum surface temperature reduction		Climate Resilience
Description and justification	The surface temperature tool can be used to model the maximum surface temperature expected in a neighbourhood, taking into account the evaporative cooling effect of the vegetation. Since the implementation of	

	nature-based solutions will usually result in an increase in vegetation cover, it should be possible to observe a decrease in the modelled maximum surface temperature under each climate change scenario (including the baseline).	
Definition	The STAR Tools are surface temperature and runoff tools for assessing the potential of green infrastructure in adapting urban areas to climate change. They are freely available at <u>http://maps.merseyforest.org.uk/grabs/</u> .	
Strengths and weaknesses	This KPI requires and is based in specific software; however, this software is freely available online.	
Measurement procedure and tool	The software includes scenarios for different parameters (temperature, precipitation and land cover, etc.). However, these scenarios were developed for a concrete area (North West England). Therefore, information must be provided to build the scenarios in other cities outside this area.	
Scale of measurement	Neighbourhood to metropolitan area	
Data source		
Required data	Data need to be provided in the case of locations outside North West England (temperature scenarios, land cover scenarios, precipitation scenarios, etc.).	
Data input type		
Data collection frequency	Not applicable, it is a model.	
Level of expertise required	Technician	
expertise	Technician This KPI is directly related to KPI which measures temperature values, such as <i>Decrease in mean or peak</i> <i>daytime local temperatures</i> and <i>Temperature reduction in</i> <i>urban areas.</i> In addition its results can be related with the changes in energy consumption, such as <i>Saving in energy</i> <i>use due to improved</i> GI. KPIs related with people's well- being can be affected by these measures, as the temperature reduction means a better thermal comfort: <i>Perceptions of citizens on urban nature, increase in walking</i> <i>and cycling in and around areas of interventions.</i>	
expertise required Synergies with	This KPI is directly related to KPI which measures temperature values, such as <i>Decrease in mean or peak</i> <i>daytime local temperatures</i> and <i>Temperature reduction in</i> <i>urban areas.</i> In addition its results can be related with the changes in energy consumption, such as <i>Saving in energy</i> <i>use due to improved</i> GI. Mean or peak day measurements	time temperature – Direct	Climate Resilience
Description and justification	Green urban infrastructure can change adaptation by reducing temperatures with the help of s increased evapotranspiration. (infrastructure can also provide shelter from wind, thereby red (Cheng, Cheung, & Chu, 2010) microclimate, green infrastruct	air and surface shading and through Conversely, green urban insulation from cold and/or ucing heating requirements . By moderating the urban
