Betweenness centrality	Green Space Management
<b>Description and justification</b>	<p>The betweenness centrality is a mathematical concept of graph theory. It can be measured for a node or an edge, and quantifies the number of times a node or an edge acts as a link in the shortest path between two other green areas with certain size. This can be used to assess the importance of streets and connections in the urban green infrastructure, and to detect missing links. It needs a representation of the urban green network as a graph, an abstract structure that sums up the relation between objects disregarding their actual physical appearance.</p> <p>Here you provide examples:</p> <p>An new NBS can change the physical communication network affecting the pedestrian flows, with repercussions or benefits to economic activities in the area nearby, and conversely on a social level.</p> <p>Dismissed tramway tracks converted in a walkway would change the connectivity of an area, turning a barrier to a space of connectivity between green areas.</p>
<b>Definition</b>	<p>The computation of betweenness centrality in urban green networks needs a representation of the city street network as graph. The edges of a graph represent the streets, while the nodes represent the intersections and NBS. The weight of an edge is the actual distance between two</p>

	nodes. The graph can be undirected for the modelling of pedestrian fluxes, and directed in for vehicular traffic.
<b>Strengths and weaknesses</b>	
<b>Measurement procedure and tool</b>	<p>The betweenness centrality of a node <math>v</math> is the sum, on every couple of nodes <math>(s, t)</math>, of the ratios between the number of shortest paths, between those two nodes <math>s</math> and <math>t</math>, passing through the node <math>v</math> and the total number of shortest paths between <math>s</math> and <math>t</math>.</p> $C_b(v) = \sum_{s \neq t \neq v \in V} \frac{\sigma_{st}(v)}{\sigma_{st}} (1)$ <p>where <math>C_b(v)</math> is the betweenness centrality for the <math>v</math> node</p> <p><math>\sigma_{st}(v)</math> is the sum of shortest paths between two nodes <math>s</math> and <math>t</math> passing through <math>v</math></p> <p><math>\sigma_{st}</math> is the total number of shortest paths in the graph between <math>s</math> and <math>t</math>.</p> <p>This can be calculated for edges (i.e., streets) too.</p> <p><math>C_b(a)</math> is the betweenness of an edge. The formula is virtually the same, but the path has to pass through the entire edge and not just through a node.</p> $C_b(a) = \sum_{(s,t) \neq a} \frac{\sigma_{st}(v)}{\sigma_{st}}$ <p>In graphs representing urban networks, it could be more convenient to use a special case of the betweenness centrality, called stress centrality <math>C_s(v)</math>, which does not account for equivalent shortest paths since in most urban context given two nodes there is only one.</p> $C_s(v) = \sum_{s \neq t \neq v \in V} \sigma_{st}(v)$ <p>Tools: graph representation and centrality computation softwares or libraries, like: Osmnx, NetworkX, GraphTool, BoostGraph.</p>
<b>Scale of measurement</b>	Neighbourhood and city scale
<b>Data source</b>	
<b>Required data</b>	- Urban graph: an abstract representation of the street networks of a city or neighbourhood, where the links between green spaces and NBS with certain minimum area represented by streets and nodes

<b>Data input type</b>	<ul style="list-style-type: none"> <li>- Municipality databases</li> <li>- Open sources like Open Street Map</li> <li>- Proprietary sources like Google, TomTom etc.</li> </ul>
<b>Data collection frequency</b>	Before / after the project's implementation, to characterize its effects on the local environment
<b>Level of expertise required</b>	It requires some kind of training, but it can be related to generally known concepts such as congestion.
<b>Synergies with other indicators</b>	Connectivity of green spaces and Accessibility indicators have similar aspects, measuring the availability of green areas or the network of green areas in an urban area.
<b>Connection with SDGs</b>	SDG 11 Sustainable Cities and Communities, SDG 13 Climate action, SDG 15 Life on land
<b>Opportunities for participatory data collection</b>	Citizens can upload data to a specific website, where a database is created to gather information from users.
