### 9.3 Number of non-native species introduced

**Project Name:** CONNECTING Nature (Grant Agreement no. 730222)

**Author/s and affiliations:** Stuart Connop

*Sustainability Research Institute, University of East London, UK*

Number of non-native animal species		Biodiversity
<b>Description and justification</b>	Proportion of non-native animal and/or plant species introduced within an area as part of a nature-based solution scheme	
<b>Definition</b>	<p>Non-native species are those that have been transported to regions beyond their natural range. In terms of biodiversity objectives, these species can:</p> <ul style="list-style-type: none"> <li>• create a risk of harm if they become invasive;</li> <li>• provide biodiversity benefits (e.g., complementing native species provision to extend flowering seasons for nectar and pollen collecting insects)</li> <li>• reduce the number of native species within a scheme</li> </ul>	
<b>Strengths and weaknesses</b>	Results can support the evaluation of the original aims of a nature-based solution scheme and can monitor performance against these aims over time. Classification of native and non-native can be complicated by naturalised and invasive species.	
<b>Measurement procedure and tool</b>	Proportion is calculated on the basis of the number of non-native species divided by the total number of species (i.e., the number of non-native species plus the total number of native species).	
<b>Scale of measurement</b>	% of species in a defined area	
<b>Data source</b>		

<b>Required data</b>	Survey data
<b>Data input type</b>	Quantitative
<b>Data collection frequency</b>	Typically annual, but can be less frequent if resources are stretched.
<b>Level of expertise required</b>	High expertise is typically required for species identification. This requirement can be reduced if an index of easily identifiable species is created as a proxy
<b>Synergies with other indicators</b>	Builds from number of native species indicator
<b>Connection with SDGs</b>	Strongest link to SDGs 14 & 15. However there are links to all SDGs except 1 and 5: Biodiversity underpins food production; Links between biodiversity and health & wellbeing benefits; Links to environmental education; Links between biodiversity and water quality; Links between biodiversity and clean energy (biosolar, biofuel); Job creation; Improved green infrastructure and industry associated with biodiversity (potential disservices also); Social equality in relation to access to nature; Sustainable urban development; Biodiversity a good indicator of responsible consumption; Climate change adaptation; More sustainable water management; Biodiversity benefits; Environmental Justice in relation to biodiversity; Opportunities for collaborative working.
<b>Opportunities for participatory data collection</b>	Surveying represents an excellent opportunity for widening participation.
